

## PlaylistPage

This article is designated for administrators.

### About

This module controls the visibility of playlists.

- To enable the Channel Playlist functionality, navigate to the [Channelplaylists](#) module.
- To enable the ability to add content to personal playlists, navigate to the [Addtoplaylists](#) module.
- To enable the ability for users to grab embed codes of playlists, navigate to the [Embedplaylist](#) module.

 This module depends on enabling the [Theming](#) module.

### Configure

1. Go to your KMS or KAF admin page, and navigate to the **PlaylistPage** module. Your link should look like this: `https://{your_KMS_URL}/admin/config/tab/playlistPage`.

The **PlaylistPage** window displays.

**playerID** - The playerId field should already be populated. To change the playerId, see [The Kaltura Player Getting Started Guide](#).

2. **Thumblink** - Choose how you'd like the thumbnail link to behave:
  - Redirect to Playlist Player - This will redirect the user to a dedicated playlist page with the player pointing to the selected media.
  - Redirect to Single Media page - This will take the user to the single media page, without the context of the playlist.

 Please note that this applies to **manual** playlists only. For **dynamic** playlists configured in the [Templatepages](#) module, such as "Most recent" or "Most viewed", (excluding "Custom playlist"), clicking on the thumbnail will exclusively direct you to the entry page and not the playlist page.

3. Click **Save**.

Access the [Headermenu](#) module to change or remove the "My Playlist" link that is automatically created in the user pull down menu. Access the [Theming](#) module to turn on the theming based playlist grid page design.

Example of playlist with Thumblink set to **Redirect to Playlist player**:

Example of playlist with Thumblink set to **Redirect to single media page**:

[template("cat-subscribe")]
