

Emailtemplates

 This article is designated for administrators.

Use this module to select or create a registration template.

- Be certain that you do not have Access Control Profiles setup for any specific domains.
- There are four types of mails in the KMS registration
 - registrationEmailTemplates (verification mail)
 - confirmationEmailTemplates (confirmation mail)
 - passwordEmailTemplates (reset password mail)
 - passwordConfirmEmailTemplates (password updated successfully)
- Each templates has the following configurations:
 - languageCode - for events supporting multiple languages. You may configure a mail template per local.
 - subject - the subject that will be displayed in the mail
 - template - the body of the mail in HTML
- All mails support the following tokens: {FIRSTNAME} {LASTNAME} {COMPANY} {COUNTRY} {EMAIL} {URL}
- You can add a template per local code by clicking addRegistrationTemplate.

Field	Description
template	Localized versions of a specific email template. Add a template here.
templateName	The template name - used to identify the template
localizedTemplate	Templates for a specific locales. When no locale fit - the template for En will be used.
languageCode	The template language code. Default is En, used when no other selection fit.
subject	The email subject.
body	The email body in html. This field supports custom tokens from the language module and also the following local tokens: {FIRSTNAME} {LASTNAME} {TITLE} {COMPANY} {COUNTRY} {EMAIL} {URL}
bodyAsText	Used for the calendar invites only. While the body will be shown in the invite email with HTML, the bodyAsText should be without any HTML and will be seen in the calendar invite itself. Tokens are supported. siteRegistration module is further configured to support this type of invitation.

[template("cat-subscribe")]
